

Amendments to the Abstract:

Please amend the abstract as follows:

An analyzer and a structure for analysis with high performance are provided which can reduce contamination between the reagents when the valve components or a plurality of reagents are included. ~~The present invention is a~~ A chemical analyzer to which a sample is introduced and into which a structure for holding a reagent reacting with the above described sample is housed, ~~including~~ includes a mechanism for detecting the ~~above described~~ sample after the ~~above described~~ reaction; ~~in which the above described~~. The structure includes a reagent cartridge having reagent storing parts for storing a plurality of reagents, a connection part to which the above described reagent cartridge is connected, and a channel cartridge having reagent channels through which a plurality of the above described reagents flow, a sample channel through which the above described testing object flows, and a reaction region where the above described reagent is reacted with the above described testing object.
